Interop Summit 2018
23/02/2018

Jean Jochmans
ICT manager
Crossroads Bank for Social security

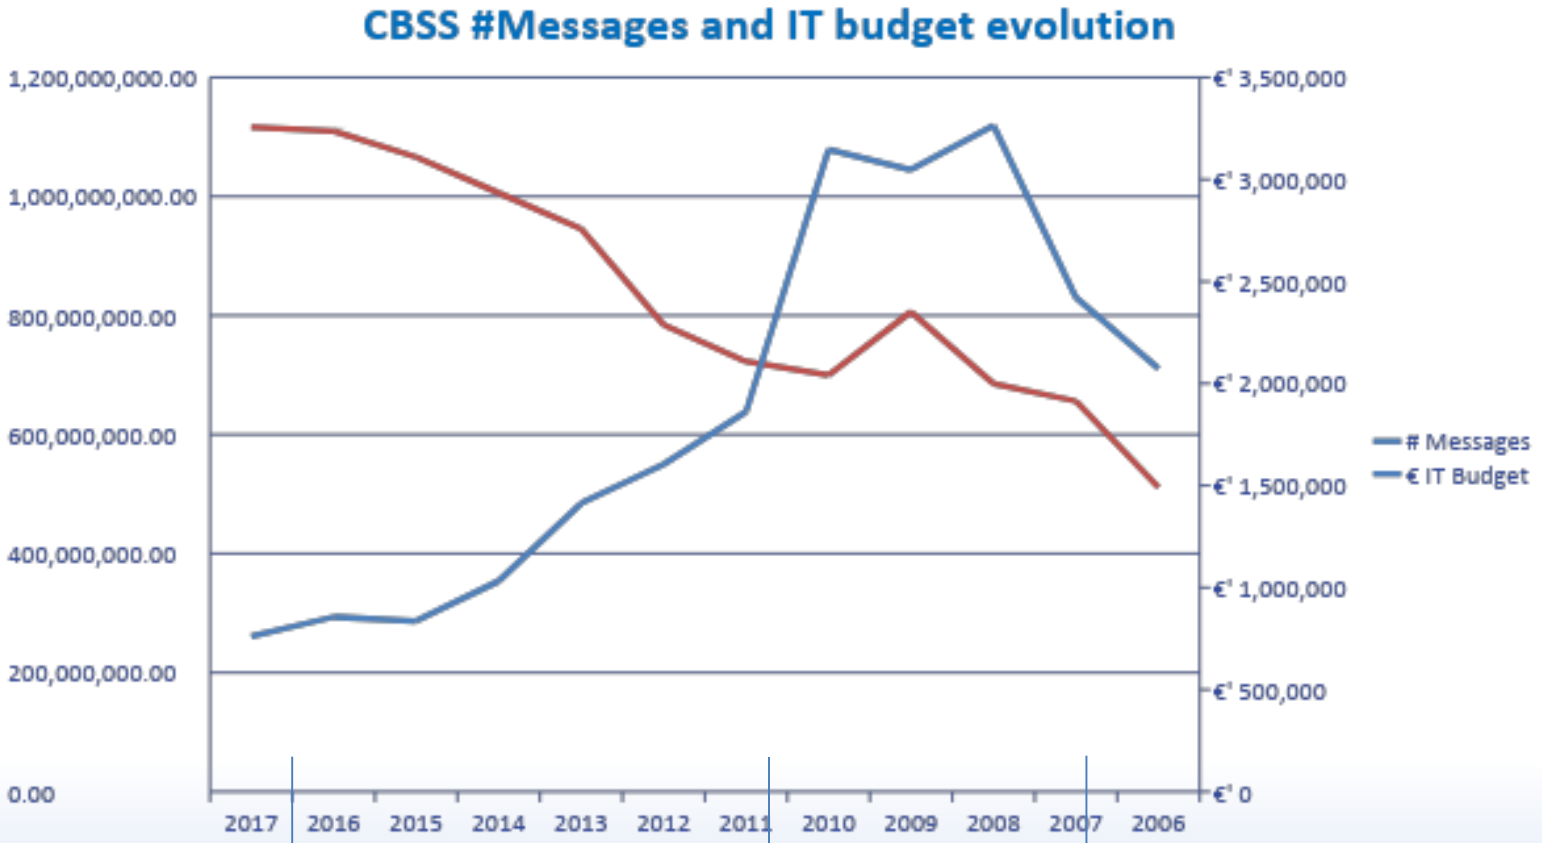

Crossroads Bank for Social security

Crossroads Bank for Social security

- federal public institution of social security, founded in 1991
- a network between all 3000 social sector actors with a secure connection to the internet, the federal MAN, regional extranets, extranets between local authorities and the Belgian interbanking network
- 220 electronic services for mutual information exchange amongst actors in the social sector, defined after process optimization
- in 2017, > 1 billion electronic messages were exchanged amongst actors in the social sector, which saved as many paper exchanges
- electronic services for citizens
  maximal automatic granting of benefits based on electronic information exchange between actors in the social sector

Crossroads Bank for Social security

What is G-Cloud?

- **Shared** public ICT program
  - current target: federal public services (FPS, PPS, Public Institutions of Social Security, Institutions of Public Benefit)
  - can be extended to other interested authorities
- **Hybrid community cloud model**
  - use of public cloud if possible
  - private community cloud cloud hosted in data centers, managed by the government
  - operational implementation with strong involvement of the private sector

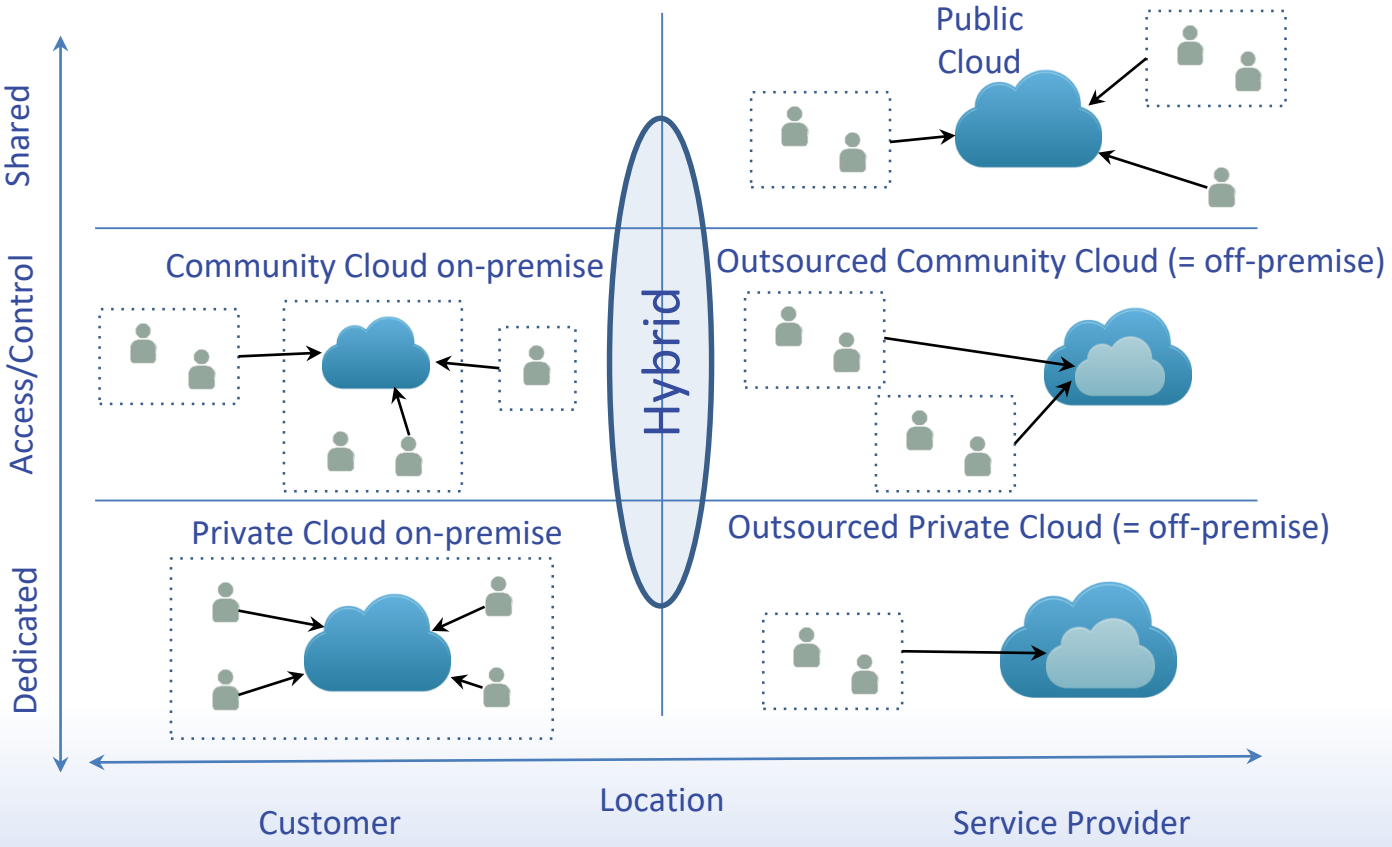

Basic principles

- Maximum synergy when possible and when generating efficiency gains and/or savings while maintaining or improving the quality of the services provided to the customer
- In line with the synergy program: assignment to the one who is the most capable of proposing a form of shared services
- Synergy based on result orientation, sense of responsibility and trust

Community Cloud Vision

- **For the government, by the government**
  - Close partnership and collaboration with the private sector
- **Community Cloud Vision**
  - Not purely limited to governance aspects
  - Also service providership/ownership
- **Decision criteria** to "**insource**" or "**outsource**"?
  - Service Type
  - Business Criticality
  - Security, Confidentiality and Legal requirements
  - Quality of Service
  - Technological Complexity
  - Core Business Focus
  - Service Roadmap and Vision
  - Exit Strategy
  - Price, ...
- **Hybrid Cloud model**
  - Depending on the above a mix of private/public + on-premise/off-premise + ...

Cloud deployment types

What is G-Cloud ?

A program including synergy projects

Synergy for existing as well as new services

For public services

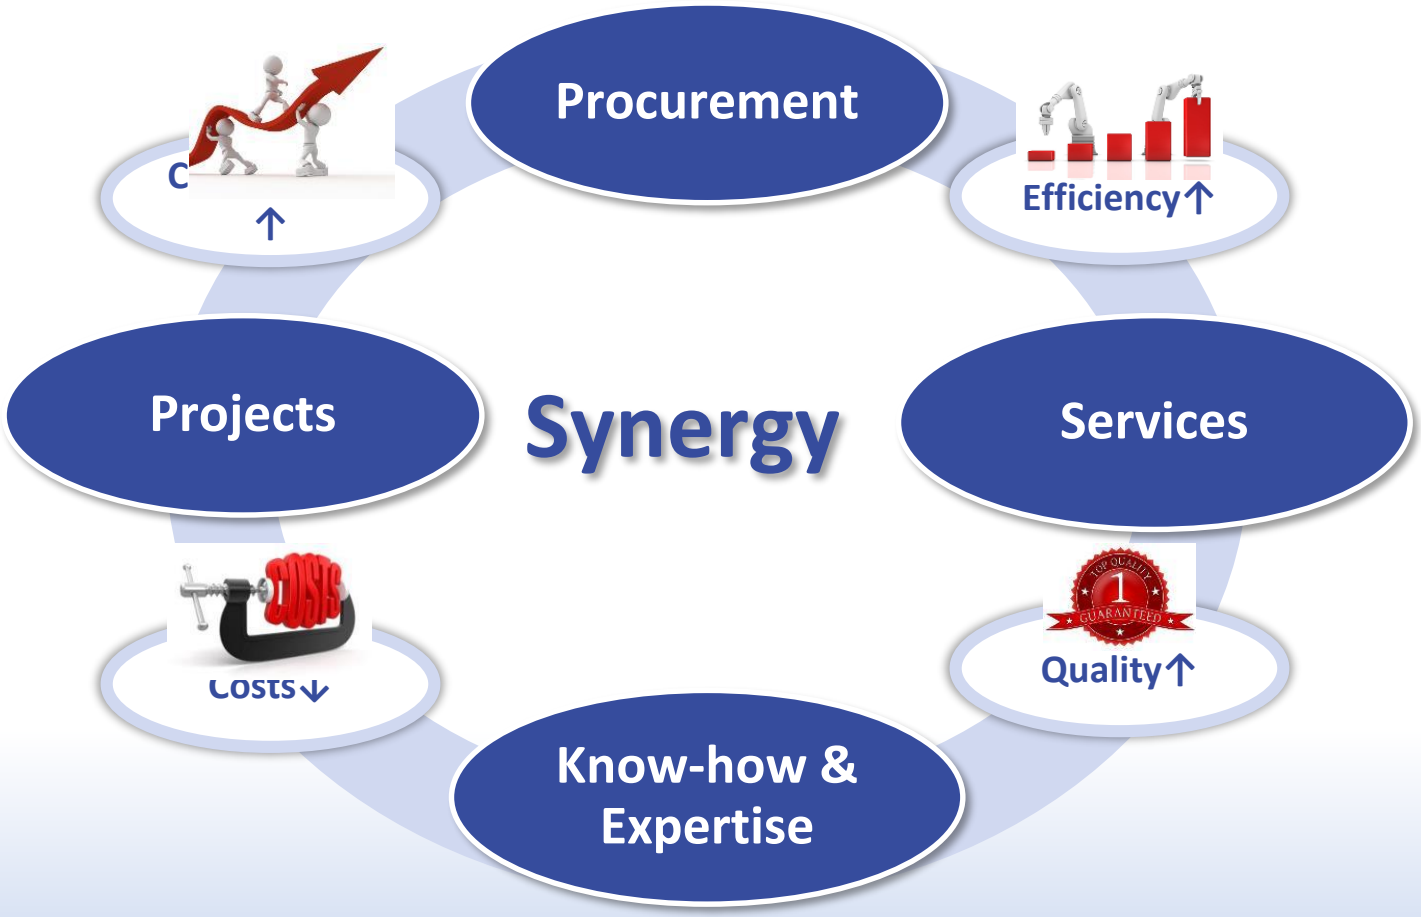

Managed by public services

In cooperation with the **private sector**

G-Cloud ‘products’

Why G-Cloud?

Creation of **economies of scale**: efficiency and high quality/availability

Respect of **confidentiality** and **data protection**

Bigger **focus on business applications and flexibility** in order to realize them

Why G-Cloud?

Greater weight during negotiations with suppliers

Pooling of knowledge and resources

Technological evolution faster available for everyone

Opportunities and challenges

Opportunities

- Flexibility
- Quality
- Economies of scale
- Self-service
- Cooperation
- Cost management

Challenges

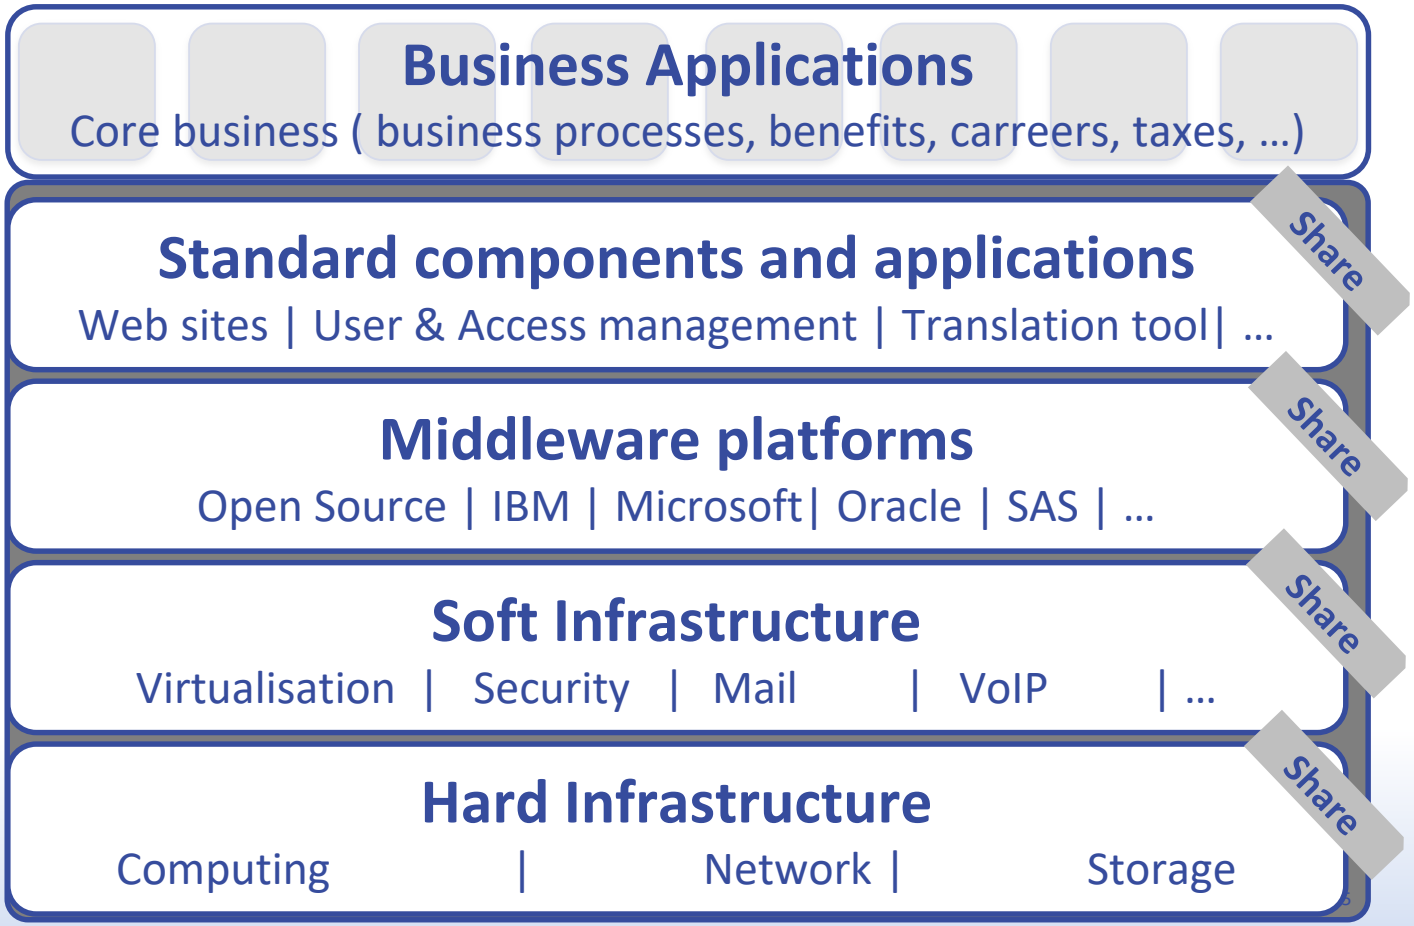

- Security
- Confidentiality
- Continuity
- Know-how
- Strategic management

G-Cloud success factors

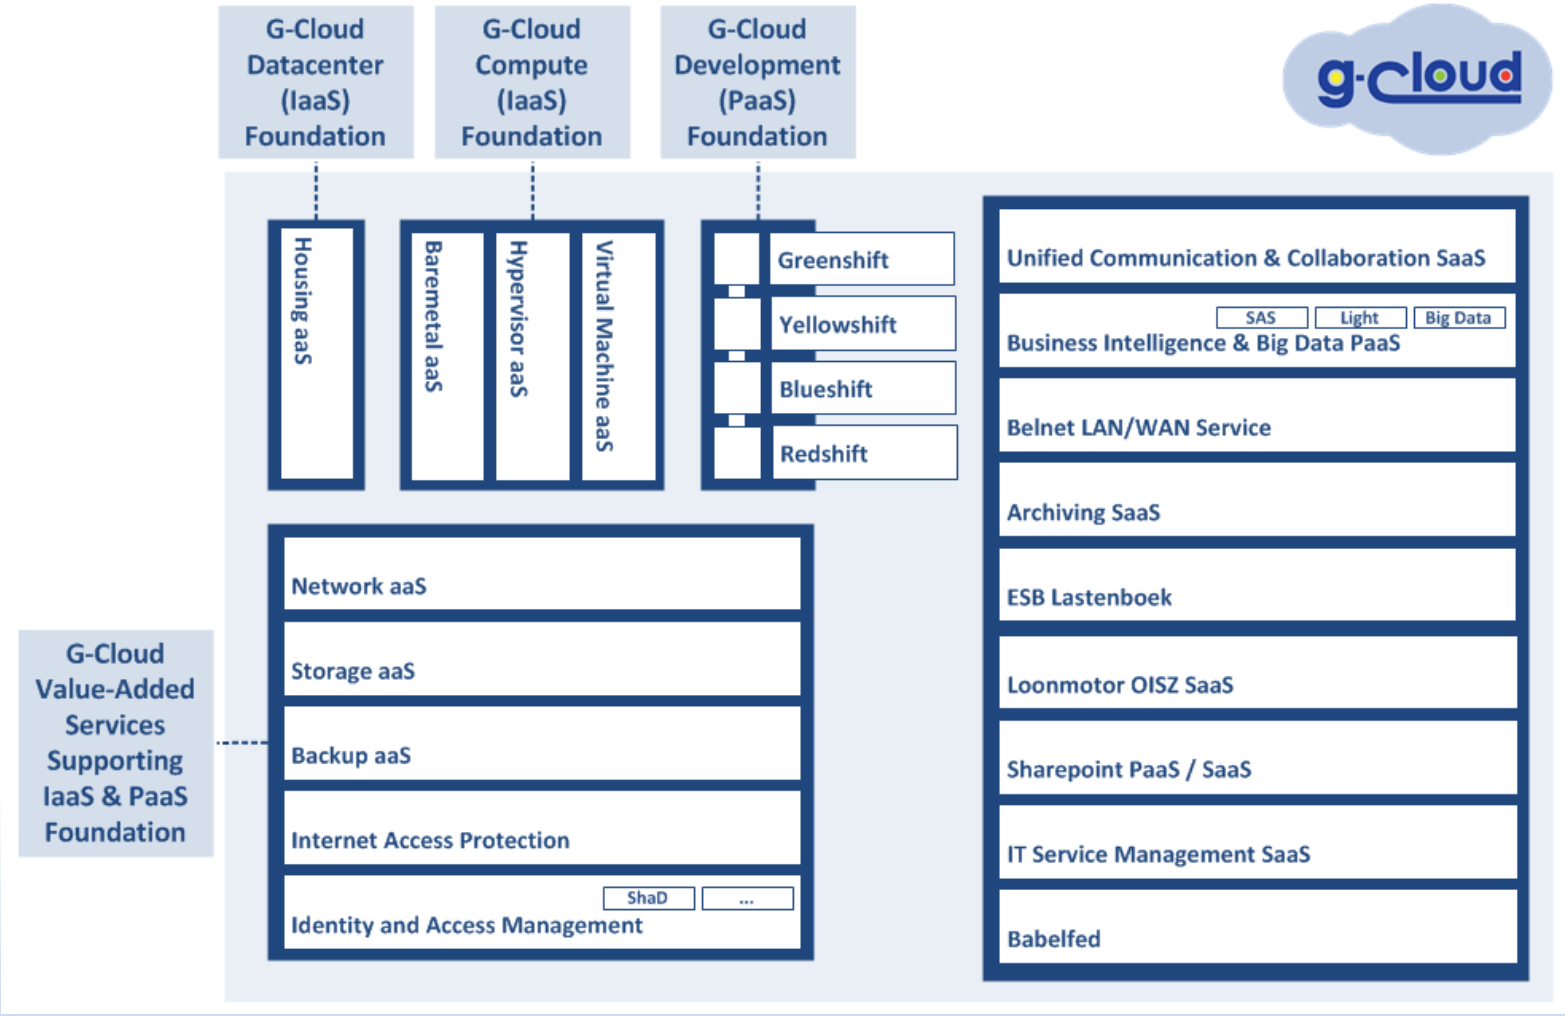

- Efficiency
- Adequate security measures (risk↘)
- Optimal cooperation and trust between the institutions
- Differentiation of the offer: neither ‘one size fits all’ nor tailor-made work
- Capacity management
- A phased approach, no ‘big bang’
- Quality service: service / SLA

G-Cloud: focus

G-Cloud Service Portfolio: Overview

Status G-Cloud Service Portfolio v2017

SOFTWARE - STANDAARD COMPONENTEN EN TOEPASSINGEN

BABELFED	**UCC** SHAREPOINT BASIC O365	**REGISTER**	**IT SERVICE MANAGEMENT**
BECONNECTED	**SHAREPOINT** BASIC ON PREMISE	**CSAM** AANMELDEN	
WEB CONTENT MANAGEMENT	**SHAREPOINT** ADVANCED ON PREMISE	**IWF** INTELLIGENT WEB FORMS	

PLATFORM - ONTWIKKELING EN GESPECIALISEERDE TECHNISCHE TOOLS

GREENSHIFT OPEN SOURCE PAAS	**REDSHIFT** ORACLE PAAS	**BIDA** SAS BUSINESS INTELLIGENCE	**BIDA** LIGHT TALEND
BLUESHIFT IBM PAAS	**SERVICE PLATFORM**	**BIDA** SAS VISUAL ANALYTICS	**BIDA** BIG DATA & ANALYTICS PAAS
YELLOWSHIFT MICROSOFT PAAS			

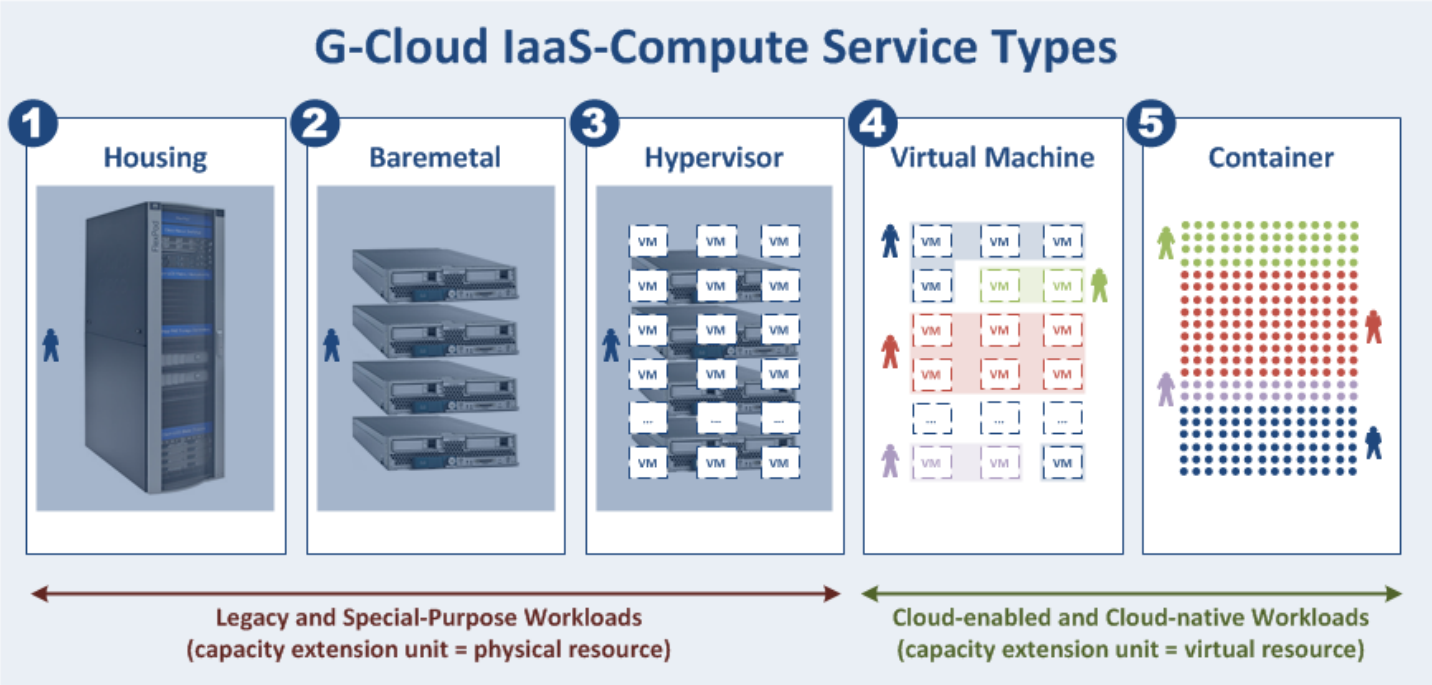

INFRASTRUCTUUR - SERVICES ("ZACHTE" INFRA)

UCC VOICE/IM	**UCC** EXCHANGE ON PREMISE	**SHAD** V1 FEDERATION SERVICES	**ARCHIVING**
UCC CONTACT CENTER	**UCC** EXCHANGE O365	**SHAD** V2 DOMAIN SERVICES	**BACKUP**
UCC MOBILE DEVICE MANAGEMENT	**INTERNET ACCESS PROTECTION**	**SHAD** V3 ONLINE	

INFRASTRUCTUUR - FUNDAMENTEN ("HARDE" INFRA)

COMPUTE VIRTUAL MACHINE	**HOUSING**	**FEDWAN**	**STORAGE**
COMPUTE HYPERVISOR	**COMPUTE** BAREMETAL	**FEDMAN**	

Compute Types versus Workloads

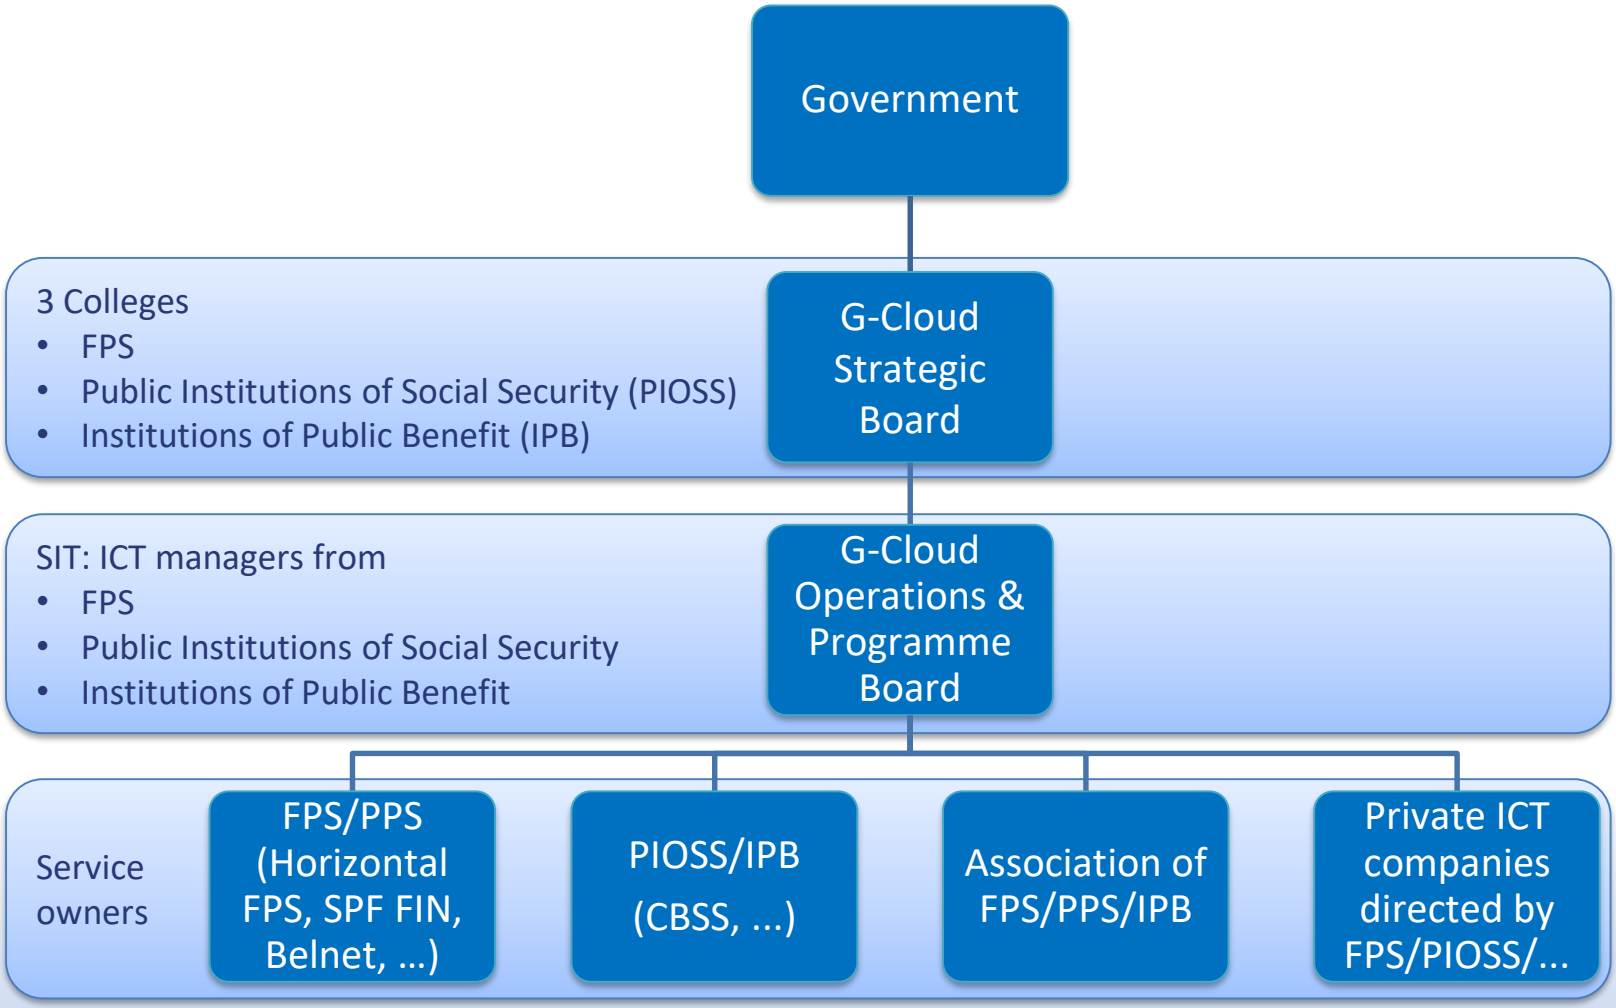

Consumers in this area are typically less agnostic about the lower layers of the technology stack (e.g. Server and network model/vendor, hypervisor, OS, ...)

G-Cloud and the private sector

- G-Cloud ≠ IT insourcing
- Public procurement
  translation tool, Converged Infrastructure, Unified Communications, network security, storage, back-up...
- In consultation with the sector for several specific platforms
  IBM, Microsoft, Oracle, SAS...

G-Cloud governance

Role of the G-Cloud Strategic Board

- set out the G-Cloud vision
- determine the priorities
- ensure that each G-Cloud service is provided by a Service Owner having the necessary competences
- follow the services (availability, performance, capacity) (SLA)
- ensure an adequate cost allocation method
- follow the program management (‘projects’)
- ensure the general policy for the way operations should be proposed
- provide an input for the ICT policy of the government
- implement the ICT policy and report to the government
- the members report to the College which they participate in

Role of the G-Cloud Operational & Program Board

- deliver the necessary input to the G-Cloud Strategic Board
- realize the priorities set by the Board in respect of the SLAs
- suggest to which ‘service owner’ a G-Cloud service should be assigned to
- determine the features, the architecture and the security of the delivered services
- manage the services catalogue
- determine the specifications calendar
- carry out the program management
- ensure HR support of the employees who work for the different G-Cloud services
- Report to the colleagues of the SIT (IT directors)

G-Cloud governance

Concrete technical projects

Interinstitutional cooperation for specific projects

- Depending on the interest and commitment of federal services

G-Cloud - Financial aspects

- The cost of a service is
  - either borne by the responsible institution
  - or divided between the customers of the service
- '**pay-for-use'** as much as possible
- Challenges :
  - G-Cloud services cheaper than internal implementation (**TCO** - Total Cost of Ownership)
  - Cost sharing :
    - Mixed teams
    - Reuse of existing infrastructure and services

G-Cloud : Shared procurement

- Cooperation regarding the public procurements
  - Juridical: central procurement agency clause
  - Know-how: specialized in ICT purchases
  - Simplicity: less administrative work for the private sector and the state
  - Possibility to accelerate the purchases and to avoid double specifications procedures
  - Price reductions thanks to the volume
- Software licences
  - Negotiations with the providers
  - Exchange of unused licences

G-Cloud : Impact

- Microsoft licenses(O365) price reduction
  ca. € 500 000 / year
- Clients and volumes ↑ => price reduction of G-Cloud services
  Compute -12%, storage -40% in 9 months
- Reuse of « central procurement clause »

G-Cloud - Human resources

- 3500 collaborators with an IT profile working for the federal state
- War-for-talent and inverted age pyramid
- Cost-sharing organization
- Impact on ICT employees: shift from routine work to the creation of innovative solutions
- Realization of the projects with 'Tiger Teams', i.e. virtual teams containing experts from the different institutions
- Automation of operationnal tasks
  - Systems availibility ⇑
  - Shared environments (economies of scale)
  - Invest more in core business and business challenges
  - Balance between stability , risk management and innovation

Project realization

- Identification of a concrete need of an institution → is pooling possible?
- Are the CIOs interested?
- Composition of an interinstitutional project group
  - scope definition
  - methodology
  - costs / benefits
- Realization of the project
  - tender
  - in-house development
  - or a combination of the two
- ! Transition project mode -> service

G-Cloud - Security and policies

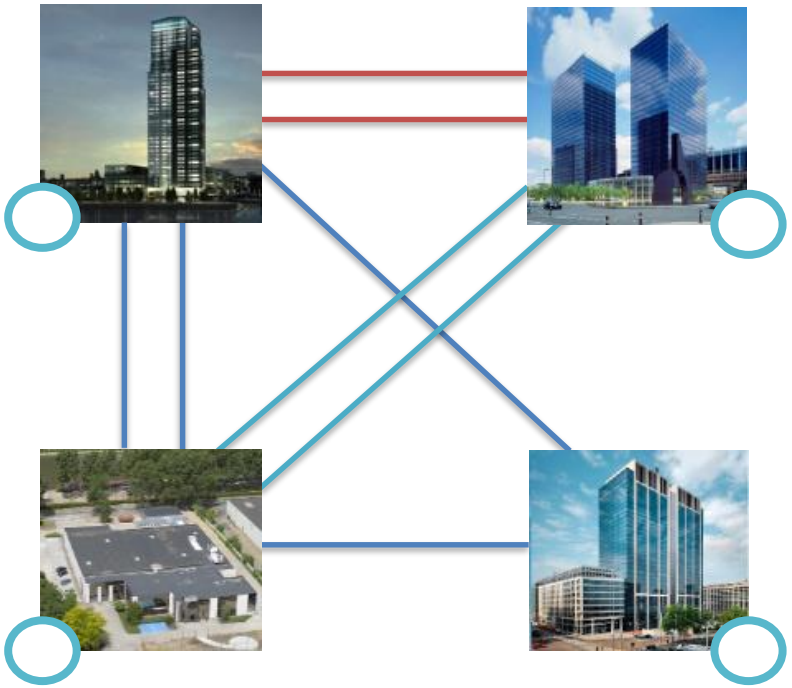

- Crucial elements of the G-Cloud
  - Pooling of services
  - Risk coverage
- Not oriented towards highly specific use cases (e.g. state security...)
- Security framework compliant with the standards
- G-Cloud project <-> security needs
- Audits and control

Data center consolidation

Cooperation: Belgian Buildings Agency/ FPS Finances / Smals

FROM	TO
• ca 40 data centers	• ca 4 data centers
• ≠ scale	• large scale
• legacy, complexity	• standardised
• high-cost connectivity per data center	• high-speed fibre interconnection
• ≠ service levels	• 24x7 services, SLA (end-to-end): >99,9%
• power & cooling limits	• future-proof power & cooling
• separate supervision	• shared supervision

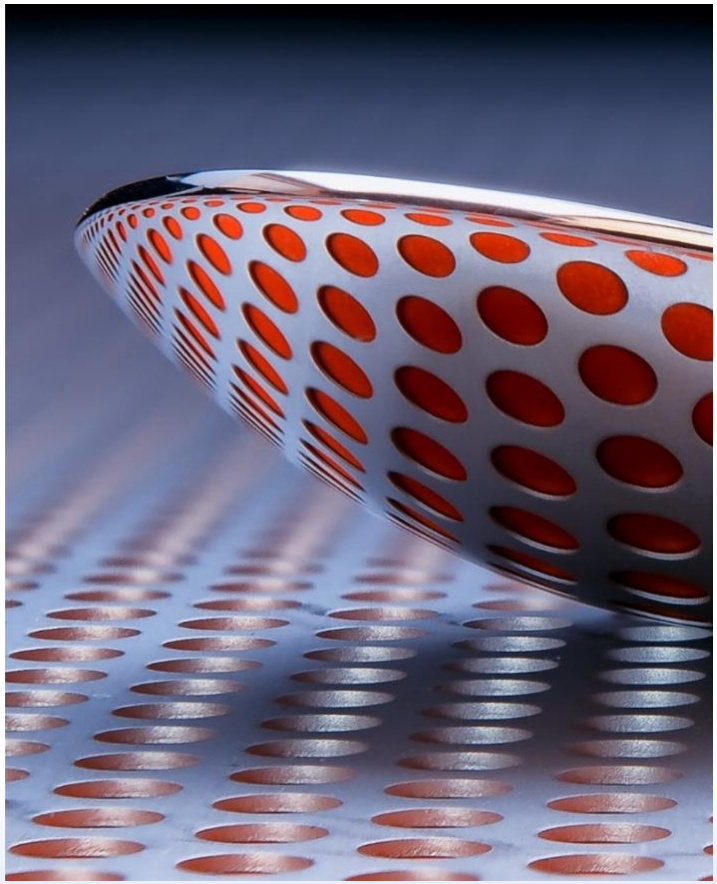

Data center consolidation

Fibre connections

Belnet

Platform as a Service (PaaS) in the G-Cloud

- Abstraction of the underlying platform for developers
- High automation degree (‘zero touch deployment’)
- Higher productivity
- DevOps way of working
- ‘Shifts’:

  Green (open source : Openshift / JBOSS / Docker), Blue (IBM), Yellow (Microsoft), Red (Oracle)
